LibreOffice 5.3 is not yet available in Fedora's software center. If you are LibreOffice user, then version 5.3 should make you super happy. It comes with the much-awaited ribbon interface and tons of new features. In fact this is the biggest upgrade in LibreOffice's history!

Before installing version 5.3, I recommend to uninstall the previous version as conflicts may arise. To remove the previous version launch 'Terminal' and enter the following command:

```
sudo dnf remove libreoffice*
```

Enter root password and then enter 'y' when you see the prompt in terminal.

Install LibreOffice 5.3 in Fedora

STEP 1: Download LibreOffice RPM binaries from official webpage.

[Download LibreOffice 5.3 64-bit version](#) [Download LibreOffice 5.3 32-bit version](#)

STEP 2: Extract the contents of the downloaded tar.gz file.

STEP 3: Launch Terminal and navigate into the RPMS sub-directory in the extracted folder. Notice that you folder name may be different.

```
cd Downloads
```

```
cd LibreOffice_5.3.0.3_Linux_x86-64_rpm
```

```
cd RPMS
```

STEP 4: Enter the following command to install all the RPM binaries in that folder.

```
sudo dnf install *.rpm
```

That's it.
