

Ubuntu 18.04 update hibernate hangs

 stackoverflow.com/questions/52067410/ubuntu-18-04-update-hibernate-hangs

2

Here are all the "possible" steps for Ubuntu 18.04, make sure all of them passes. It's a little tricky since you are upgrading.

1- Make sure hibernate is installed

```
sudo apt install pm-utils hibernate pm-hibernate
```

Then try:

```
sudo pm-hibernate
```

(for you this step doesn't work)

2- Make sure you have enough swap AND you are pointing to the correct one

Run this to check your swap:

```
grep swap /etc/fstab
```

You should get something like:

```
swap was on /dev/nvme0n1p5 during installation
UUID=xyz-bb32-4ad2-aaeb-xyz none swap sw
```

If not, then you need to create one (I guess this will work for you).

3- Copy the UUID of the swap into grub

Copy the UUID from the previous step into the grub file (I'm pretty sure it's your problem).

```
sudo gedit /etc/default/grub
```

Then change the resume to point to the UUID not the dev name:

```
GRUB_CMDLINE_LINUX_DEFAULT="quiet splash resume=UUID=xyz-bb32-4ad2-aaeb-xyz"
```

4- Enable Hibernation (if not already)

```
sudo gedit /var/lib/polkit-1/localauthority/50-local.d/com.ubuntu.enable-hibernate.pkla
```

Then past in that file:

```
[Re-enable hibernate by default in upower]
Identity=unix-user:*
Action=org.freedesktop.upower.hibernate
ResultActive=yes
[Re-enable hibernate by default in logind]
Identity=unix-user:*
Action=org.freedesktop.login1.hibernate
ResultActive=yes
```

5- Hibernate when lid is closed

```
sudo gedit /etc/systemd/logind.conf
```

And include

```
#HandleLidSwitch=suspend
HandleLidSwitch=hibernate
```
