All things Linux and GNU/Linux -- this is neither a community exclusively about the kernel Linux, nor is exclusively about the GNU operating system.

About

GNU/Linux is a free and open source software operating system for computers. The operating system is a collection of the basic instructions that tell the electronic parts of the computer what to do and how to work. Free, Libre and open source software (FLOSS) means that everyone has the freedom to use it, see how it works, and change it.

GNU/Linux is a collaborative effort between the GNU project, formed in 1983 to develop the GNU operating system and the development team of Linux, a kernel. Initially Linux was intended to develop into an operating system of its own, but these plans were shelved somewhere along the way.

Linux is also used without GNU in embedded systems, mobile phones and appliances, often with BusyBox or other such embedded tools.
