This question has been asked before and already has an answer. If those answers do not fully address your question, please [ask a new question](#).

10

```
gsettings set org.gnome.settings-daemon.plugins.power button-power shutdown
```

will change your the behaviour of the power button of your system from interactive (default) to immediate normal shutdown.

The command is `gsettings set org.gnome.settings-daemon.plugins.power button-power <option>`

Available options are:

- Blank: does nothing
- Suspend: makes your system suspend
- Shutdown: starts a normal issued shutdown procedure
- Hibernate: hibernates your system
- Nothing: does nothing
- Log out: log your user out
