You need DDRL memory, not DDR3.

You have mixed voltages which is why the PC is burping.

Do yourself a favor and get this memory for your PC...

Great thanks, looking at the memory you've suggested though that says DDR3 in the product description as well?

You're very welcome.

It is the low voltage memory 1.35V.

The chip you got is 1.5V and the original chip in the notebook is 1.35V.

That is what the L stands for at the end of the part number (and shows on the G.Skill memory chip # I posted).

Model F3-1600C11S-4GSL
