tifys • 6 years ago

THE commands that worked for me are:

- 1) sudo sh -c 'echo "deb http://deb.opera.com/opera/ stable non-free" >> /etc/apt/sources.list.d/opera.list'
- 2) sudo sh -c 'wget -O http://deb.opera.com/archiv... | apt-key add -'
- 3) sudo apt-get update
- 9 ^ V Reply Share >

quequotion • 5 years ago

>Grek

- 1. If someday you wanted to stop updating opera, you could just delete the file /etc/apt/sources.d/opera.list, instead of searching through the /etc/apt/sources.list file for opera's line in a text editor.
- 2. Would indeed be better with a \, but that confuses some people.

Your spelling is much worse than UbuntuUpdate's css.

Grek • 6 years ago

1. /etc/apt/sources.list.d/opera.list' mayby /etc/apt/sources.list' ???? why create file to new repo!

2 sudo sh -c 'echo "deb http://deb.opera.com/opera/ stable non-free" >> /etc/apt/sources.list.d/opera.list'

in onew line!

you have shit css on this site, very unusefully!

3 ^ V • Reply • Share >

Guest → Grek • 6 years ago

Agreed.

1 ^ V • Reply • Share >

Eric S → Grek • 3 years ago

That has become the de facto standard way to add sources.

Because then you just erase one file, instead of having one long file and finding your source.

If it bothers you, why don't YOU echo out to sources.list?

Alfa Ddomega • 7 months ago

hi:

In my ubuntu 14.04.05 lts, my opera no update since 13 of june with version 45.0.2552.898. this is normal? In other ubuntu 14.04.05 i'm download of official page (opera) the ppa for version 46, and all is ok, 46.0.2597.46, this is my version. In the first (version 45.0.2552.898), is my principal pc, and never have a problem with updates. any solution?

thanks.-

∧ V • Reply • Share >

Lex - → Alfa Ddomega • 6 months ago

45 is the stable version, all they patch for that is security (if they need to).

46 is beta, slightly unstable. I would say your prinicple should also use 46 if it works. There was an update pushed for both old 14.04.5 and the newer 16.04.2 that can cause the browser to either not launch or launch really slow.

It has something to do with the HWE aka Hardware Enablement stack kernel.

Check your principle PC and use this command to find out if it's 32-bit running on 64-bit hardware.

There's an easy way to do this, in terminal, type in the following and hit ENTER.

sudo apt-get install hardinfo -y

Install that package and then type in hardinfo from the terminal, let it load up. Under the computer drop down list on the left, click on "Operating System". look at the kernel section. At the end it will say something like, (i386) or (i686) or (x86_64).

If it says i386 or i686, you have a 32-bit operating system running on a 64-bit computer. If you have x86_64 you have 64-bit operating system running on 64-bit hardware.

For future reference, there is a generate report button at the top and it can save it in HTML format so you can see it in your browser or send it to someone else to look at.

When you're done you can close that window and close the terminal, too.

Lex - → Alfa Ddomega • 7 months ago

Yes, this is normal, unfortunately.

Are you using 32-bit 14.04.5 or 64-bit? The reason why I ask this is that Opera switched from their custom engine to Chromium's open source version as their rendering agent and engine. If you're using the 32-bit version of Ubuntu, it won't be directly supported anymore.

While there is 32-bit Chromium and Google Chrome being made for Microsoft Windows, it's not being made for Linux, only 64-bit. This could very well be your problem.

Are you on a 64-bit computer but only using 32-bit Ubuntu? If that's the case either move to 64-bit x86_64 image (AMD64 which also works on the x86_64 Intel series CPUs, too) and/or move up to Ubuntu 16.04 64-bit bit as an upgrade.

Depending on the reason why you're still on 14.04.5, would make sense if you want full OpenGL spec (compatibility and core profiles from OpenGL 3.1 ~ 4.5 [assuming your hardware can handle it], instead of core profile 3.1 ~ 4.5 in which not all games will work with that as of yet (this includes Linux Steam based games).

If you have an AMD UD7750 or naviar eard, you can use the AMDCDLL DDO driver made enceitically for 16.04 and that

will give you both compatibility and core profiles with full OpenGL spec., also it has support for Vulkan but you have to download the runtimes on the same site but separately and install those after you install the AMDGPU-PRO. It tells you how to do it.

Now, if you have Nvidia cards on 16.04 it's easier to do, they have their drivers here.

http://www.nvidia.com/objec...

As far as Intel drivers are, well. That can be hit and miss on 16.04. I just hope you're not using their on-board video from their CPUs.

Alfa Ddomega → Lex - • 6 months ago

HI Lex:

For me is impossible pass to 16.04 Lts, because 14.04.05 is perfect running, and don't like, move more of 4 terabytes of information by one ppa opera, when i have crhomium and firefox running. My target no is nvidia (No play games in ubuntu), is Intel, and my pc is from 2015, only two years and no change a perfect target for opera. I At this moments i have in a mini vacation, and dont put work with my prinicipal pc, i dont remember if is 64 or 32. Thanks for the answer. When at arrive at home in three or more weeks, say if is 32 or 64. But if is true and i have 32 for ubuntu and 64 for pc, sorry, but ppa opera go home to my pc.

Alfa Ddomega → Alfa Ddomega • 6 months ago

hi lex:

I'm happy becuase in one mail i found the information about you speak in the post:

Mi procesador es Intel® Core $^{\text{TM}}$ i5-4460 CPU @ 3.20GHz × 4 Graficos Intel® Haswell Desktop x86/MMX/SSE2 so 32 bits

With this dates, i clear, that opera no update never no?

In this case, opera go out of my pc.

Thanks for your time

Lex - → Alfa Ddomega • 6 months ago

I've requested more information from the browser team at Ubuntu (Canonical, Ltd.) and to see if they would continue to allow your computer to get updates.

What I've done in the past is, rewrite the / aka root directory with the new 16.04 and leave everything else but state that I will use the /home directory, just not format it.

There's many different ways to upgrade, actually.

My biggest concern is making sure your graphics work in your case before you upgrade to 16.04. Switching to it via command line is easy enough to do so without transferring 4 TB of data to the new system.

Are you currently using Haswell's graphics itself, meaning the on-board video from the CPU and not an additional card? If so, are you using Intel's restricted (non free driver)?

Alfa Ddomega → Lex - • 6 months ago

LEX:

Opera for me is the best browser, but, no change my 14.04lts, for one browser.My pc is newest only 2 years, and money is money, and in these moments for me is impossible buy or change chip intel grpahic or similars. Thanks for your time. When in 2019 april. i will change to 18.04 lts. and in this case put Opera

again.

Only a question. You think that i have problems with opera browser, with no updates, using the version 45, until to april 2019?

Thanks for all and Your Time .-

∧ V • Reply • Share >

Lex - → Alfa Ddomega • 6 months ago

I don't believe you will for as long as the updates are being directly sent via opera.com, instead of what's in the repository in Ubuntu for version 14.04, the old LTS. You can download the .deb directly from opera.com, too. The developer's editions is there, too, version 46 at current.

abuBobe • 3 years ago

Those instructions worked for me on the 1st try!

Awesome!

Thanks a lot for the post.

1. If someday you wanted to stop updating opera, you could just delete the file /etc/apt/sources.d/opera.list, instead of searching through the /etc/apt/sources.list file for opera's line in a text editor.

Agree with you brother

∧ V • Reply • Share >

fede • 4 years ago

When performing the first command, the message requiring the password from sudo doesn't show up ("wget -O - http://deb.opera.com/archiv... | sudo apt-key add -").

If you're not aware of this and haven't made any recent sudo (so it skips the password) may let you wondering what's going on.

Would it work better as " sudo sh -c 'wget -O - http://deb.opera.com/archiv... | apt-key add -' " ??

∧ V • Reply • Share >

fede → fede • 4 years ago

Also be aware that opera seems to have dropped linux development a few years back. The last linux version available is several major releasses behind windows or mac.

So, if you weren't using opera already, i'd say don't bother...

Reply • Share >

Caselogic → fede • 4 years ago

It's because they switched from Presto core to WebKit/Blink less than year ago. I roughly remember something like they will continue with linux dev, when work about few initial releases calms down..

fede → fede • 4 years ago

i lost my opera after upgrading ubuntu.

i reinstalled without much thinking about it (didn't backup anything, or read any instructions).

i'm just very happy it's working the way i left it! All settings (i think), info, extensions, even last session working! you're smarter than me, opera;)

Carl Stephenson • 5 years ago

These instructions worked well for me, except make sure there is no line break in the "Setup repository with:" command.

Following the instructions above didn't irremedially screw up my whole system, but the procedure didn't come off quite as expected. After performing the setup-key command in a terminal, I got the following (translations from the Swedish in parentheses): AcSIĀ¥r upp [Looking up] deb.opera.com... [sudo] password for mhenriday: 195.189.143.183 deb.opera.com|195.189.143.183|:80... ansluten [connected].
br> HTTP-beg¤ran [request] skickad [sent], v¤ntar pĀ¥ svar [awaiting response]... 200 OK
br> LĤngd [Length]: 2441 (2,4K) [application/pgp-keys]
br> Sparar till [Saving to]: "STDOUT" till standard ut [out] [2441/2441]» and froze there. I then opened a new terminal and entered the «sudo sh -c 'echo "deb http://deb.opera.com/opera/ stable non-free" > >
 /etc/apt/sources.list.d/opera.list'» command, with the following result : «sh: Syntax error: newline unexpected» I then tried «sudo sh -c 'echo "deb http://deb.opera.com/opera/ stable non-free"
/etc/apt/sources.list.d/opera.list'»
 and received this encouraging notice : «sh: /etc/apt/sources.list.d/opera.list: Permission denied» after which I gave up and installed the latest version of Opera manually. The strange thing is that I now see «http://deb.opera.com/opera/ stable non-free» and «http://deb.opera.com/opera-beta/ stable non-free» listed among my repositories and the Opera key listed under «Authentication». I wonder if this means that coming Opera updates will automatically be offered for installation....

posted at 2010-10-15 08:55:24 UTC by mhenriday (http://www.stumbleupon.com/stumbler/mhenriday/)

same happened to myself, error message "newline unexpected" was caused by the cut and paste, put a new line in.Therefore,take your cursor back to where the new line is "/etc/apt" and so on, press backspace, and that should fix it
