Strange new folder after each restart

1

Today I ran Fedora system update (I have Fedora 29, this update wasnt from 28, just a regular update). After that, each time I start or restart my notebook, new folder with invalid encoding appears in my home directory. Is there something I can do with that?

Hi! It happened to me too! Not sure why. To fix it, what I did is check /etc/xdg/autostart folder. A new file apparently created same day than update called :

org.freedesktop.problems.applet.desktop

I deleted it and my issue is gone. Had to be creative in order to delete those folders though, since they didn't have properly encoded characters such as ????
